

# Re-Organize Data Advanced

- **Text Classification:** You can use ChatGPT to categorize text data into different classes or categories based on their content.
- Text classification is the task of assigning predefined categories or labels to text data based on its content.
- You could use text classification to categorize news articles into topics like sports, politics, technology, etc.
- Using ChatGPT for text classification involves feeding the model a large dataset of pre-labeled text data, and training it to predict the correct label for new, unseen text data.
- **Example:** Take 20 historical events output in tabular format and ask for the following classifications...
- 1. Type of event (war, political, natural disaster, etc.)
- 2. Region (North America, Europe, Asia, etc.)
- 3. Century (19th, 20th, 21st)
- 4. Impact (economic, social, political, etc.)
- 5. Scale (global, regional, local)
